Role: AI Product Engineer (US Fintech)

Re: Ingeniero de Producto de IA

Building AI products that turn a business idea into something that actually ships and works is what I do every day. I run a GenAI platform in production where I build autonomous agents, API integrations and automations on OpenAI and Anthropic Claude, with RAG, function calling and embeddings, and I work hands on with agentic coding assistants. For a fast growing US fintech this matters twice, because I also carry real fintech depth: I shipped digital scoring for online credit card origination and a payment settlement portal earlier in my career.

What I bring is the full path from idea to working solution. I take a business need, design the agent or automation, wire the APIs and integrations, ship it and then iterate with monitoring and data. Under my leadership the company reached Registered Partner status in Anthropic's partner program, and MedicalHubAssist, our healthcare AI product, was recognized by Revista DINERO. I am comfortable working directly with teams in the United States in professional English, fully remote from Colombia.

One honest note so you can calibrate: my automations are built mostly with code and agent orchestration, Inngest and the OpenAI and Claude APIs, more than with no code platforms like n8n, Zapier or Make, though I pick those up quickly, which is what your posting means by similar tools. The hard part, real hands on fluency building agents, APIs and automations that deliver business impact, I already bring. I would love to show you what I have shipped. Thank you for your time.

Best regards,

Roberto Aguirre Guardia
