Turbo AI · Founders and Hiring Team

Role: Product Manager

Application: Product Manager

Turbo's whole bet is that product leaders, engineers, and AI agents can work as one team, available to any founder anywhere. I did not just bet on that future. I built it. As Head of AI and founder, I run a squad where autonomous agents and human work ship real product together, across development, QA, and research, and under my leadership the company reached Registered Partner status in Anthropic's partner program. I own the full product lifecycle, from strategy and scoping to delivery and quality, and I operate like a founder because I am one. So the future Turbo is racing toward is the present I already work in every day.

Being the dedicated product brain for two or three founders at once, turning messy ideas into clear plans and shipping fast, is what I have done for fifteen years. At NTT DATA I was the product and delivery lead across parallel workstreams for a demanding client, translating vision into roadmaps and prioritized plans, scoping features end to end, partnering with engineering to answer feasibility and unblock delivery, and owning quality as the last line of defense so clients were never surprised. I built a credit origination platform under real chaos, consolidating fragmented apps into one hub, deciding with incomplete information and escalating dependencies before they became blockers, and shipped it to production. I make decisions fast, I keep the work clear, and I protect the client's name as if it were mine.

One point of candor. My formal titles have been in AI and delivery leadership rather than a career product manager, though I own products end to end for real, today. And on UX, I scope, prototype, and think in flows, systems, and constraints, but I do not design the visual layer pixel by pixel; I partner closely on that. What I guarantee is the core of this role: building from zero, shipping fast with AI as part of the team rather than a feature, and holding the line on quality and outcomes. I would love to help build something the world has never seen. Thank you for your time.

Best regards,

Roberto Aguirre Guardia
